(57) **ABSTRACT**

Systems, methods, and media for controlling the presentation of search results with advertisement indications are provided. In some embodiments, systems for controlling the presentation of search results with advertisement indications are provided, the systems comprising: at least one hardware processor configure to: receive a search request; identify a plurality of pieces of media content corresponding to the search request; for each of the plurality of pieces of media content, determine if an advertisement is configured to be presented with a presentation of the piece of media content; generate search results identifying the plurality of pieces of media content; and generate presentation data that specifies the manner in which the search results are to be presented based on the determination.

# SYSTEMS, METHODS, AND MEDIA FOR CONTROLLING THE PRESENTATION OF SEARCH RESULTS WITH ADVERTISEMENT INDICATIONS

## CROSS-REFERENCE TO RELATED APPLICATION

This application is a continuation of U.S. patent application Ser. No. 13/706,026, filed on Dec. 5, 2012, which is hereby incorporated by reference herein its entirety.

## BACKGROUND

With the explosive growth of the Internet, high-speed communications, and digital recording technology, there has been a continued growth in the availability of online media content (such as videos, audio, images, graphics, text, etc.) and the number of instances of users accessing such online media content. For example, video sharing Web sites are incredibly popular and users can use such Web sites to be presented with videos on almost any conceivable subject.

With the explosive growth of the Internet, high-speed communications, and digital recording technology, there has been a continued growth in the availability of online media content (such as videos, audio, images, graphics, text, etc.) and the number of instances of users accessing such online media content. For example, video sharing Web sites are incredibly popular and users can use such Web sites to be presented with videos on almost any conceivable subject.

In many instances, media content is configured to be presented with an advertisement. This advertisement can provide a revenue stream for the host of the Web site and/or the provider of the media content. To insure that this revenue stream is not lost, in many instances users cannot view the media content without first viewing the advertisement, or at least a portion of the advertisement.

Frequently, however, a user may object to having to be presented with an advertisement before being able to be presented with desired media content. For example, a user may object because the user does not want to watch the advertisement, because the user does not want to use bandwidth on the media content, or for any other suitable reason. To make matters worse, in many instances a user only becomes aware that an advertisement is to be presented after at least a significant portion of the advertisement has been transferred to the user's user device (e.g., such as a mobile phone).

Accordingly, mechanisms for improving a user's experience when accessing media content are desirable.

## SUMMARY

Systems, methods, and media for controlling the presentation of search results with advertisement indications are provided. In some embodiments, systems for controlling the presentation of search results with advertisement indications are provided, the systems comprising: at least one hardware processor configured to: receive a search request; identify a plurality of pieces of media content corresponding to the search request; for each of the plurality of pieces of media content, determine if an advertisement is configured to be presented with a presentation of the piece of media content; generate search results identifying the plurality of pieces of media content; and generate presentation data that specifies the manner in which the search results are to be presented based on the determination.

2

In some embodiments, methods for controlling the presentation of search results with advertisement indications are provided, the methods comprising: receiving a search request; identifying a plurality of pieces of media content corresponding to the search request; for each of the plurality of pieces of media content, determining if an advertisement is configured to be presented with a presentation of the piece of media content; generating search results identifying the plurality of pieces of media content; and generating presentation data that specifies the manner in which the search results are to be presented based on the determination.

In some embodiments, non-transitory computer-readable media containing computer-executable instructions that, when executed by a processor, cause the processor to perform a method for controlling the presentation of search results with advertisement indications are provided, the method comprising: receiving a search request; identifying a plurality of pieces of media content corresponding to the search request; for each of the plurality of pieces of media content, determining if an advertisement is configured to be presented with a presentation of the piece of media content; generating search results identifying the plurality of pieces of media content; and generating presentation data that specifies the manner in which the search results are to be presented based on the determination.

## BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is an example of a user interface for a search mechanism showing advertisement indications as indicators in accordance with some embodiments.

FIG. 2 is another example of a user interface for a search mechanism showing advertisement indications using search result groupings in accordance with some embodiments.

FIG. 3 is yet another example of a user interface for a search mechanism showing advertisement indications using different fonts or font styles in accordance with some embodiments.

FIG. 4 is still another example of a user interface for a search mechanism showing advertisement indications using advertisement-characteristic-displaying indicators in accordance with some embodiments.

FIG. 5 is an example of hardware that can be used in accordance with some embodiments.

FIG. 6 is an example of hardware that can be used in a database, a server, and/or a user device in accordance with some embodiments.

FIG. 7 is an example of a process for a user device in accordance with some embodiments.

FIG. 8 is an example of a process for a search engine server in accordance with some embodiments.

FIG. 9 is an example of a process for a media content server in accordance with some embodiments.

## DETAILED DESCRIPTION

Systems, methods, and media for controlling the presentation of search results with advertisement indications are provided.

In accordance with some embodiments, mechanisms are provided for determining whether a piece of media content, such as a video, audio, an image, graphics, text, etc., corresponding to a search request is to be presented with an advertisement, and, if so, for providing an indication that the advertisement is to be presented in search results identifying the piece of media content.

3

Turning to FIG. 1, an example **100** of a user interface for searching for and accessing media content on a user device in accordance with some embodiments is illustrated. As shown, in some embodiments, user interface **100** can include a provider logo **102**, a search term entry field **104**, a search button **106**, a filter option **108**, a sort option **110**, and search results **112**.

Logo **102** can be any suitable logo of any suitable provider of user interface **100** and can include any suitable text, graphics, images, video, etc. in accordance with some embodiments.

Search term entry field **104** can be any suitable field for entering search terms for a media content search in accordance with some embodiments. For example, as shown, field **104** can be a text entry box for receiving typed text. As another example, field **104** can be a window for entering hand-written text. Search button **106** can be any suitable mechanism for receiving an indication from a user that a search can be performed in accordance with some embodiments. In some embodiments, search button **106** can be omitted and a search can be performed for each character or word entered in field **104** or can be performed after a suitable period of time after a user has entered a search term in field **104**.

Filter option **108** can be any suitable mechanism, such as a drop down menu, for receiving a user's selection of any suitable one or more filters to be applied to search results in accordance with some embodiments. For example, as shown, filter option **108** can be used to limit search results to content posted in a given period of time (e.g., the past two years). In some embodiments, filter option **108** can be omitted.

Sort option **110** can be any suitable mechanism, such as a drop down menu, for receiving a user's selection of any suitable one or more sort controls to be applied to search results in accordance with some embodiments. For example, as shown, sort option **110** can be used to sort search results by the number of views associated with the results. In some embodiments, sort option **110** can be omitted.

Search results **112** can be any suitable search results, such as such results **114**, **116**, **118**, and **120**, for any suitable media content in accordance with some embodiments. The search results can include any suitable information and that information can be presented in any suitable manner. For example, in some embodiments, information can be presented using text, graphics, images, video, sounds, audio, etc. As another, more-particular example, this information can include a thumbnail image **122**, a title in text format **124**, a name of the source of the content in text format **124**, an age of the content in text format **128**, and a count of the number of views of the content in text format **130**.

As also shown, for some of the search results, such as search results **114** and **118**, an indicator, such as indicators **132** and **134**, respectively, may be used to provide an indication that the content corresponding to the search results, when presented, will be presented with an advertisement. Such an indicator can be any suitable icon, text, image, video, logo, graphics, sound, audio, etc. For example, as shown in FIG. 1, the word "includes ad" can be presented next to the corresponding search results. As another example, any suitable icon can be presented next to the corresponding search results. As yet another example, when a user taps or hovers over a search result, a sound can be presented to indicate that an advertisement will be presented with the content.

One or more of search results **112** can be selected by a user in order to request a presentation of the selected media

4

content. The user can select one or more of the search results in any suitable manner. For example, the user can select a search result by touching a search result presented on a touch-screen display. As another example, the user can select a search result by highlighting a search result and pressing an enter button or a play button.

FIG. 2 shows another example **200** of a user interface for searching for and accessing media content on a user device in accordance with some embodiments. As illustrated, in user interface **200**, an indication can be provided that an advertisement will be presented with content corresponding to search results by arranging the search results into two or more groups in accordance with some embodiments. For example, one group **236** may indicate that the results each "Include Ad," and hence that an advertisement will be presented when the content is presented. Another group **238** may indicate that the results are "Ad-Free," and hence that the corresponding content will be presented without an advertisement.

FIG. 3 illustrates yet another example **300** of a user interface for searching for and accessing media content on a user device in accordance with some embodiments. As shown, in user interface **300**, an indication can be provided that an advertisement will be presented with content corresponding to search results by altering the manner in which information about the content is presented. For example, as shown, search results **314** and **318** can be presented such that the title of the content is presented in a different font or style (e.g., bold italics) to indicate that an advertisement will be presented with content corresponding to these search results. Search results **316** and **320**, on the other hand, can be presented in a different font or style (e.g., non-bold, non-italics) to indicate that content corresponding to these search results will be presented without an advertisement.

In some embodiments, an indicator that is used to indicate that an advertisement will be presented with content corresponding to a search result can provide any suitable information about the advertisement. For example, as shown in FIG. 4, indicators **432** and **434** can indicate that advertisements to be presented with content corresponding to the shown search results are "viral" (that is, extremely popular) advertisements. As a result, the user may be enticed to select one of these search results in order to see a popular advertisement, which the user may enjoy. As another example, an indicator may indicate a company, a product, a service, a length, a format, and/or any other suitable characteristic(s) associated with an advertisement to be presented with content associated with a search result.

Turning to FIG. 5, an example **500** of hardware that can be used in accordance with some embodiments is shown. As illustrated, hardware **500** can include a search engine server **502**, a search engine database **504**, a media content server **506**, an advertisement server **508**, a communication network **510**, and one or more user devices **512**, such as a mobile phone **514**, a tablet computer **516**, and/or a laptop computer **518**.

Search engine server **502** can be any suitable search engine server in accordance with some embodiments. For example, search engine server **502** can be a search engine that receives search requests sent from a Web browser and returns search results in a Web page. As another example, search engine server **502** can be a search engine that receives search requests from a dedicated media presentation application and returns search results in a format specifically tailored for that application.

In some embodiments, search engine server **502** can control the manner in which the search results are presented

5

to a user. For example, server **502** can control whether the search results are presented in one or more of the manners described above in connection with FIGS. 1-4.

Search engine database **504** can be any suitable search engine database for storing data relating to media content available for presentation in some embodiments. For example, this data can include the title of content, the source of content, the number of views of content, a thumbnail associated with content, and/or any other suitable information. In some embodiments, this data can include information indicating which content, when presented, will be presented with an advertisement. In some embodiments, this data can specify characteristics of the advertisements to be presented with content (e.g., as described above in connection with FIG. 4).

Media content server **506** can be any suitable media content server for storing media content and for delivering the content to a user device **512** of a user in some embodiments. For example, media content server **506** can be a server that streams media content to a user device **512** via communication network **510**. Media content provided by media content server **506** can be any suitable content such as video content, audio content, television programs, movies, cartoons, music, sound effects, audio-books, streaming live content (e.g., a streaming radio show, a live concert, a live political event, etc.), pre-recorded content, etc.

Advertisement server **508** can be any suitable advertisement server for storing advertisements and for delivering the advertisements to a user device **512** of a user in some embodiments. For example, advertisement server **508** can be a server that streams video advertisements (e.g., commercials) to a user device **512** via communication network **510**. Advertisements provided by advertisement server **508** can be any suitable advertisements such as video advertisements, audio advertisements, commercials, graphics, text, images, video clips, etc.

Communication network **510** can be any suitable combination of one or more wired and/or wireless networks in some embodiments. For example, communication network can include any one or more of the Internet, a mobile data network, a satellite network, a local area network, a wide area network, a telephone network, a cable television network, a WiFi network, a WiMax network, and/or any other suitable communication network.

User devices **512** can include any suitable user devices for generating search requests for media content, for presenting search results to a user as described herein, and for presenting media content, in some embodiments. For example, in some embodiments, user devices **512** can include mobile devices, such as mobile phone **514**, tablet computer **516**, laptop computer **518**, a vehicle (e.g., car, boat, airplane, etc.) entertainment system, a portable media player, etc. Although not shown in FIG. 5, as another example, in some embodiments, user devices **512** can include non-mobile devices, such as a desktop computer, a set-top box, a smart television, a streaming media player, a game console, etc.

Although search engine server **502**, search engine database **504**, media content server **506**, and advertisement server **508** are illustrated as separate devices, any of these devices can be combined into any one or more devices in some embodiments. Also, although only one of each of search engine server **502**, search engine database **504**, media content server **506**, and advertisement server **508** is shown in FIG. 5 to avoid over-complicating the figure, any suitable one or more of these devices can be used in some embodiments.

6

Although three user devices **514**, **516**, and **518** are shown in FIG. 5 to avoid over-complicating the drawing, any suitable number of these devices, and any suitable types of these devices, can be used in some embodiments.

Search engine server **502**, search engine database **504**, media content server **506**, advertisement server **508**, and user devices **512** can be implemented using any suitable hardware in some embodiments. For example, in some embodiments, devices **502**, **504**, **506**, **508**, and/or **512** can be implemented using any suitable general purpose computer or special purpose computer. For example, a mobile phone may be implemented using a special purpose computer. Any such general purpose computer or special purpose computer can include any suitable hardware. For example, as illustrated in example hardware **600** of FIG. 6, such hardware can include a hardware processor **602**, memory and/or storage **604**, an input device controller **606**, an input device **608**, display/audio drivers **610**, display and audio output circuitry **612**, communication interface(s) **614**, an antenna **616**, and a bus **618**.

Hardware processor **602** can include any suitable hardware processor, such as a microprocessor, a micro-controller, digital signal processor, dedicated logic, and/or any other suitable circuitry for controlling the functioning of a general purpose computer or special purpose computer in some embodiments.

Memory and/or storage **604** can be any suitable memory and/or storage for storing programs, data, media content, advertisements, etc. in some embodiments. For example, memory and/or storage **604** can include random access memory, read only memory, flash memory, hard disk storage, optical media, etc.

Input device controller **606** can be any suitable circuitry for controlling and receiving input from one or more input devices **608** in some embodiments. For example, input device controller **606** can be circuitry for receiving input from a touch screen, from one or more buttons, from a voice recognition circuit, from a microphone, from a camera, from an optical sensor, from an accelerometer, from a temperature sensor, from a near field sensor, etc.

Display/audio drivers **610** can be any suitable circuitry for controlling and driving output to one or more display and audio output circuitries **612** in some embodiments. For example, display/audio drivers **610** can be circuitry for driving an LCD display, a speaker, an LED, etc.

Communication interface(s) **614** can be any suitable circuitry for interfacing with one or more communication networks, such as networks **510** in some embodiments. For example, interface(s) **614** can include network interface card circuitry, wireless communication circuitry, etc.

Antenna **616** can be any suitable one or more antennas for wirelessly communicating with a communication network in some embodiments. In some embodiments, antenna **616** can be omitted when not needed.

Bus **618** can be any suitable mechanism for communicating between two or more of components **602**, **604**, **606**, **610**, and **614** in some embodiments.

Any other suitable components can be included in hardware **600** in accordance with some embodiments.

Turning to FIGS. 7, 8, and 9, examples **700**, **800**, and **900** of processes that can be performed in a user device **512**, a search engine server **502**, and a media content server **506**, respectively, in accordance with some embodiments are shown.

More particularly, process **700** of FIG. 7 is an example of a process for requesting a search, receiving and presenting search results, and selecting and presenting media content

7

and/or advertisements in accordance with some embodiments. Such a process can be performed in a user device **512** in some embodiments. As illustrated, after process **700** has begun at **702**, the process can detect a user activation of a search interface at **704**. This activation can be detected in response to a user browsing to a search engine Web page, in response to a user selecting a search widget on a user device, in response to a user activating a media player, etc.

Next, at **706**, process **700** can present a search interface. Any suitable search interface can be presented. For example, in some embodiments, a search interface such as that described in any of FIGS. **1-4** can be presented in some embodiments.

At **708**, the process can next receive the search terms. These search terms can be received in response to a user typing the terms, in response to a user speaking the terms, in response to the user selecting the terms from a menu, based on previously selected content, in response to the user pasting the terms, etc.

Then, at **710**, process **700** can send the search terms to a search engine. These search terms can be sent in any suitable manner in some embodiments. For example, in some embodiments, these terms can be sent in any suitable protocol using any suitable type of communication interface.

Process **700** can then receive search results and presentation data at **712**. Any suitable search results, in any suitable format, and any suitable presentation data can be received in some embodiments. For example, search results and presentation data as described above in connection with FIGS. **1-4** can be received in some embodiments. These search results and presentation data can be received in any suitable manner in some embodiments. For example, in some embodiments, these search results and presentation data can be received in any suitable protocol using any suitable type of communication interface.

At **714**, process **700** can then present the search results in accordance with the presentation data. This presentation can be performed in any suitable manner. For example, in some embodiments, this presentation can be performed as described above in connection with FIGS. **1-4**.

Next, at **716**, process **700** can receive a selection of one or more of the search results in any suitable manner. For example, process **700** can receive a selection of a search result in response to a user touching a search result presented on a touch-screen display. As another example, process **700** can receive a selection of a search result in response to a user highlighting a search result and pressing an enter button or a play button.

At **718**, the process can then send a request for the corresponding content to a media content server based on the selection. This request can be sent in any suitable manner in some embodiments. For example, in some embodiments, this request can be sent in any suitable protocol using any suitable type of communication interface.

At **720**, process **700** can receive media content and/or an advertisement responsive to the request sent at **718**. This media content and/or advertisement can be received in any suitable manner in some embodiments. For example, in some embodiments, this media content and/or advertisement can be received in any suitable protocol using any suitable type of communication interface.

Next, at **722**, the media content and/or advertisement can be presented in any suitable manner. For example, an advertisement may be presented before content can be presented, an advertisement may be presented while content

8

is being presented, etc. As another example, an advertisement and/or content can be presented as video, audio, images, text, etc.

Finally, at **724**, process **700** can end.

Process **800** of FIG. **8** is an example of a process for receiving and responding to a search request in accordance with some embodiments. Such a process can be performed in a search engine server **502** in some embodiments. As illustrated, after process **800** has begun at **802**, the process can receive search terms from a search interface at **804** in some embodiments. These search terms can be received in any suitable manner in some embodiments. For example, in some embodiments, these terms can be received in any suitable protocol using any suitable type of communication interface.

Next, at **806**, process **800** can generate search results corresponding to the search terms in some embodiments. These search results can be generated in any suitable manner in some embodiments. For example, in some embodiments, these search results can be generated based on data received from search engine database **504** in response to a database query.

At **808**, process **800** can then determine which search results correspond to advertisements. This determination can be made in any suitable manner. For example, in some embodiments, this determination can be made based on data retrieved from search engine database **504** for the search results. As another example, this information can be made based on data retrieved from media content server **506** and/or advertisement server **508**.

Then, at **810**, process **800** can generate presentation data based on which search results correspond to advertisements in some embodiments. Any suitable presentation data can be generated in some embodiments. For example, in some embodiments, presentation data can be generated to cause the search results and/or advertisement indications to be presented as described above in connection with FIGS. **1-4**.

Once the presentation data has been generated, process **800** can then send the search results and presentation data to the search interface at **812**. These search results and presentation data can be sent in any suitable manner in some embodiments. For example, in some embodiments, these search results and presentation data can be sent in any suitable protocol using any suitable type of communication interface.

Finally, at **814**, process **800** can end.

Process **900** of FIG. **9** is an example of a process for receiving and responding to a request for media content in accordance with some embodiments. Such a process can be performed in a media content server **506** in some embodiments. As illustrated, after process **900** has begun at **902**, the process can receive a request for content from the search interface at **904**. This request can be received in any suitable manner in some embodiments. For example, in some embodiments, this request can be received in any suitable protocol using any suitable type of communication interface.

Next, at **906**, the process can determine whether there is an advertisement associated with the requested media content in some embodiments. This determination can be made on any suitable basis. For example, in some embodiments, this determination can be made based on data stored in media content server **506** and/or advertisement server **508**.

If it is determined at **906** that an advertisement is associated with the requested media content, then process **900** can branch to **908** to retrieve an advertisement from an advertisement server. This advertisement can be retrieved in any suitable manner. For example, in some embodiments,

9

this advertisement can be retrieved by requesting and receiving a full copy of the advertisement. As another example, in some embodiments, this advertisement can be retrieved by requesting and receiving a link or a pointer that can be used to access a full copy of the advertisement.

If it is determined at **906**, however, that no advertisement is associated with the requested media content, or after completing **908**, process **900** can branch to **910** to retrieve the requested content. This content can be retrieved in any suitable manner. For example, in some embodiments, this content can be retrieved by requesting and receiving from storage in server **506** a full copy of the content. As another example, in some embodiments, this content can be retrieved by requesting and receiving a link or a pointer that can be used to access a full copy of the content.

Process **900** can then send the retrieved content and/or the retrieved advertisement to the user device at **914**. This media content and/or advertisement can be sent in any suitable manner in some embodiments. For example, in some embodiments, this media content and/or advertisement can be sent in any suitable protocol using any suitable type of communication interface.

Finally, at **914**, process **900** can end.

It should be understood that at least some of the above described steps of the processes of FIGS. 7-9 can be executed or performed in any order or sequence not limited to the order and sequence shown and described in the figures. Also, some of the above steps of the processes of FIGS. 7-9 can be executed or performed substantially simultaneously where appropriate or in parallel to reduce latency and processing times.

In some embodiments, any suitable computer readable media can be used for storing instructions for performing the functions and/or processes described herein. For example, in some embodiments, computer readable media can be transitory or non-transitory. For example, non-transitory computer readable media can include media such as magnetic media (such as hard disks, floppy disks, etc.), optical media (such as compact discs, digital video discs, Blu-ray discs, etc.), semiconductor media (such as flash memory, electrically programmable read only memory (EPROM), electrically erasable programmable read only memory (EEPROM), etc.), any suitable media that is not fleeting or devoid of any semblance of permanence during transmission, and/or any suitable tangible media. As another example, transitory computer readable media can include signals on networks, in wires, conductors, optical fibers, circuits, any suitable media that is fleeting and devoid of any semblance of permanence during transmission, and/or any suitable intangible media.

Although the invention has been described and illustrated in the foregoing illustrative embodiments, it is understood that the present disclosure has been made only by way of example, and that numerous changes in the details of implementation of the invention can be made without departing from the spirit and scope of the invention, which is limited only by the claims that follow. Features of the disclosed embodiments can be combined and rearranged in various ways.

What is claimed is:

1. A system for controlling the presentation of search results with advertisement indications, comprising:
  - at least one hardware processor that is configured to:
    - receive a search request;
    - identify a plurality of pieces of media content corresponding to the search request;

10

determine that an advertisement is configured to be presented with a presentation of one of the plurality of pieces of media content;

determine that no advertisement is configured to be presented with a presentation of another of the plurality of pieces of media content;

generate a first search result identifying the one of the plurality of pieces of media content;

generate a second search result identifying the other of the plurality of pieces of media content;

generate first presentation data that specifies that the first search result is to be presented in a manner that indicates that the advertisement will be presented with a presentation of the one of the plurality of pieces of media content in response to a user selecting the one of the plurality of pieces of media content;

generate second presentation data that specifies that the second search result is to be presented in a manner that indicates that no advertisement will be presented with a presentation of the other of the plurality of pieces of media content in response to a user selecting the other of the plurality of pieces of media content; and

cause the first search result to be presented in accordance with the first presentation data and cause the second search result to be presented in accordance with the second presentation data simultaneously.

2. The system of claim 1, wherein the at least one hardware processor is also configured to use the first search result, the second search result, the first presentation data, and the second presentation data to form a Web page.

3. The system of claim 2, wherein the at least one hardware processor is also configured to send the Web page to a user device.

4. The system of claim 1, wherein the at least one hardware processor is also configured to send the first search result, the second search result, the first presentation data, and the second presentation data to a user device.

5. The system of claim 1, wherein the first presentation data specifies an indication that indicates a characteristic of the advertisement.

6. The system of claim 1, wherein the first presentation data specifies a grouping to provide an indication that an advertisement will be presented with the one of the plurality of pieces of media content.

7. A method for controlling the presentation of search results with advertisement indications, comprising:

receiving a search request;

identifying a plurality of pieces of media content corresponding to the search request;

determining that an advertisement is configured to be presented with a presentation of the one of the plurality of pieces of media content;

determining that no advertisement is configured to be presented with a presentation of another of the plurality of pieces of media content;

generating a first search result identifying the one of the plurality of pieces of media content;

generating a second search result identifying the other of the plurality of pieces of media content;

generating first presentation data that specifies that the first search result is to be presented in a manner that indicates that the advertisement will be presented with a presentation of the one of the plurality of pieces of media content in response to a user selecting the one of the plurality of pieces of media content; and

## 11

generating second presentation data that specifies that the second search result is to be presented in a manner that indicates that no advertisement will be presented with a presentation of the other of the plurality of pieces of media content in response to a user selecting the other of the plurality of pieces of media content; 5  
causing the first search result to be presented in accordance with the first presentation data and causing the second search result to be presented in accordance with the second presentation data simultaneously. 10

8. The method of claim 7, further comprising using the first search result, the second search result, the first presentation data, and the second presentation data to form a Web page.

9. The method of claim 8, further comprising sending the Web page to a user device. 15

10. The method of claim 7, further comprising sending the first search result, the second search result, the first presentation data, and the second presentation data to a user device.

11. The method of claim 7, wherein the first presentation data specifies an indication that indicates a characteristic of the advertisement. 20

12. The method of claim 7, wherein the first presentation data specifies a grouping to provide an indication that an advertisement will be presented with the one of the plurality of pieces of media content. 25

13. A non-transitory computer-readable medium containing computer-executable instructions that, when executed by a processor, cause the processor to perform a method for controlling the presentation of search results with advertisement indications, the method comprising: 30

receiving a search request;

identifying a plurality of pieces of media content corresponding to the search request;

determining that an advertisement is configured to be presented with a presentation of the one of the plurality of pieces of media content; 35

determining that no advertisement is configured to be presented with a presentation of another of the plurality of pieces of media content; 40

generating a first search result identifying the one of the plurality of pieces of media content;

## 12

generating a second search result identifying the other of the plurality of pieces of media content;

generating first presentation data that specifies that the first search result is to be presented in a manner that indicates that the advertisement will be presented with a presentation of the one of the plurality of pieces of media content in response to a user selecting the one of the plurality of pieces of media content;

generating second presentation data that specifies that the second search result is to be presented in a manner that indicates that no advertisement will be presented with a presentation of the other of the plurality of pieces of media content in response to a user selecting the other of the plurality of pieces of media content;

causing the first search result to be presented in accordance with the first presentation data and causing the second search result to be presented in accordance with the second presentation data simultaneously.

14. The non-transitory computer-readable medium of claim 13, wherein the method further comprises using the first search result, the second search result, the first presentation data, and the second presentation data to form a Web page.

15. The non-transitory computer-readable medium of claim 14, wherein the method further comprises sending the Web page to a user device.

16. The non-transitory computer-readable medium of claim 13, wherein the method further comprises sending the first search result, the second search result, the first presentation data, and the second presentation data to a user device.

17. The non-transitory computer-readable medium of claim 13, wherein the first presentation data specifies an indication that indicates a characteristic of the advertisement.

18. The non-transitory computer-readable medium of claim 13, wherein the first presentation data specifies a grouping to provide an indication that an advertisement will be presented with the one of the plurality of pieces of media content.
